Pipette washer, automatic

Made of PE and PP, indispensable in the laboratory where radioactive, caustic and toxic materials are in use. The polyethylene rinser fills via the spray nozzle situated on the top rim, this eliminates backsymphoning as the water inlet is located above and away from any contaminated waters. Contaminated waters will syphon out totally once the syphon point at the top of the rinser has been reached, via the large diameter drain situated at lowest point, before refilling automatically. During washing the pipettes are housed in specially designed baskets which minimize breakages as it buffers the tips of pipettes against the soft polyethylene base.

Any ultrapure water in contact with the atmosphere has a conductivity of 1-2 µS/cm and a pH of 5, due to the small amount of CO2 (0.5 ppm) absorbed from the atmosphere.
